

CS 3440 – Forms

PEER GRADING WARNING

Peer grading means others will be looking at your work. For this entire semester you should keep everything in your web pages G rated. If you offend someone with your words or with images and they report it to me, I will have no option but to relay the complaint to the appropriate department for evaluation. Jokes are fun but offending someone is not. So, to be safe, don't do anything that could possibly be taken the wrong way and get you into serious trouble.

For today's exercise, name your document exercise5.html and place it in your exercises directory.

Add a link to this file on your main index page under cs3440.

Edit exercise5.html to create an html file that displays as shown in figure 1 below.

Details and Additional Exercises

- The form should use the post method.
- The form inputs are named: emailTo, emailFrom, emailBody, referrer, newsletter, and rating (from top to bottom).
 - o emailTo is a readonly text input with an initialized value as shown.
 - o emailFrom is an email input.
 - o emailBody is a textarea. Make this input 20 columns and 5 rows.

NOTE: The right side of emailTo, emailFrom, and emailBody won't align exactly in all browsers. Get them as close as you can and don't count off if someone's if off a bit.

 - o referrer is a select element.
 - o newsletter is a checkbox input. When the page first opens this checkbox should already be checked.
 - o rating is a set of radio inputs.
 - o The "Send Message" button is an input of type "submit".
- When "Send Message" is clicked it uses the http post method to send the information to <https://student2.cs.appstate.edu/crr/3440/homework/h3/contact/>.

This page will respond with a page that echoes back the values that were passed as post data. If you did not **name** the inputs as shown in the first step, the information won't be received properly.

You must use POST otherwise nothing will be received properly.

- Use a label element for all form input fields. All labels should have a **for** attribute; therefore, each input needs an **id** attribute.

And yes, each radio button needs a label. I name each radio button the same but make the id reflective of each individual option value. For example, all should have the **name** as rating, but the **id** could be rating_1, rating_2, rating_3, rating_4, and rating_5 respectively.

- Use fieldset and legend tags appropriately as indicated by figure 1.
- The value for each referrer input should be: google, ad, friend, other (case sensitive). The user visible options should be Google, Newspaper ad, Friend, and Other respectively.
- The values for rating should be 1, 2, 3, 4, or 5. These should function as a set and only one should be possible to be selected at a time.
- Note that "Type your message here ..." is a placeholder and disappears when you start typing text in the message textarea.
- Make emailFrom and emailBody required inputs.
- The only tags you need should be form, fieldset, legend, break, label, and the various tags associated with the inputs listed in the notes.
- Figure 2 is an example with data filled in. Figure 3 is the response to figure 2 when the submit button is clicked if everything is working properly.

Any input left blank will show up on the web page from figure 3 as "No value sent".

- Validate your html file using the [w3.org validator](http://w3.org/validator). Use the Validate by File Upload.
- Submit exercise5.html to the workshop on AsULearn.
- Make sure to peer review the exercise 4 assignments you have been assigned.
